Extreme value analysis using the R mev package

Léo Belzile[1]

EPFL, Switzerland[1]

`belzilel@gmail.com`[1]

The R mev package implements recent methodological developments for extreme value analysis, notably likelihood based inference procedures and simulation algorithms for multivariate extremes.

The tutorial will present selected topics from simulation of max-stable and R-Pareto vectors, threshold selection methods, semiparametric inference based on hidden regular variation and likelihood based inference for univariate extremes.
